Revenue approval settings

- The access to the programming parameters via front key pad and/or serial communication ports is locked.
- The front key pad (up and down keys) allows the displaying of the variables only, while the communication ports allows the transmission of the variables only.
- A proper "instrument settings" form must be filled up by the user before equipment supplying.
- WM5-96 is supplied with the desired modules plugged and sealed in the proper slots.
- WM5-96 fulfils:
 - the ANSI/IEEE C12.20-1998 requirements;
 - the CAN3-C17-M84 requirements;
 and can be certified according to:
 - C12.20-1998, class 0.5 (independent labs);
 - AE-0924 Industry Canada Approval.
 In this case there are 2 base configurations:
 1. display module + measuring input module
AV5 3 + power supply module H.
 2. display module + measuring input module
AV6 3 + power supply module H.

Alarm parameters and logic

Function Description

Input and output scaling capability. Working of the analogue outputs (y) versus input variables (x)

Figure A

The sign of measured quantity and output quantity remains the same. The output quantity is proportional to the measured quantity.

Figure D

The sign of measured quantity and output quantity remains the same. With the measured quantity being zero, the output quantity already has the value $Y1 = 0.2 Y2$. Live zero output.

Figure B

The sign of measured quantity and output quantity changes simultaneously. The output quantity is proportional to the measured quantity.

Figure E

The sign of the measured quantity changes but the one of the output quantity remains the same. The output quantity steadily increases from value X1 to value X2 of the measured quantity.

Figure C

The sign of measured quantity and output quantity remains the same. On the range X0...X1, the output quantity is zero. The range X1...X2 is delineated on the entire output range $Y0 = Y1...Y2$ and thus presented in strongly expanded form.

Figure F

The sign of the measured quantity remains the same, the one of the output quantity changes as the measured quantity leaves range X0...X1 and passes to range X1...X2 and vice versa.

NOTE: In case of fault of first insulation the current from the measuring inputs to the ground is lower than 2 mA.

(*) The given insulation is granted among outputs plugged in different slots. The modules equipped with two or four outputs have therefore non insulation among the outputs. (**) Insulation between the 2 outputs of the same module is 200V for 1 min.
