

# AVOIDING SYSTEM FAILURE BY REPLACING SINUMERIK 840 HARD DRIVES.

Avoid system downtime due to old, spinning hard drive failures.

No need to replace your SINUMERIK 840 system. Simply upgrade your outdated MMC or PCU hard drive with a new, more reliable solid state hard drive (SSD).

## DRIVE FAILURE OR SLOW DOWN

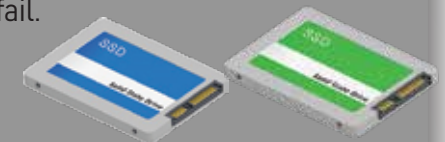

If your spinning drive fails, it's unlikely you will recover your system programs.

The best way to prevent failures is to proactively replace them.

## OUTDATED SPINNING VS. SOLID STATE

Older spinning drives are unreliable; outdated technology is bound to fail.

The new technology of Solid state drives (SSD) is safer & can help speed up your boot time.

## PROGRAM RECOVERY

The unique recovery system was created by Classic Automation. The program is duplicated from the outdated hard Drive.

## PROGRAM TRANSFER

The existing program will be imaged onto a replacement SSD and installed with new mounting hardware.
